

Team Red – Task 5

Task specification:

Task description

1. Based on the review categories given in script 03.07 on slide 2, conduct a requirements review of the requirements document from Task 4 -> **Team Red evaluates work of team Green**
2. Document your results in a short review report table (approx. 1 page), including recommendations how the requirements document could be improved.

Page	Criteria	Explanation / Comments / Improvements
x	Completeness	Function xyz is missing...
y	Consistency	xyz is inconsistent, use abc instead...
z

3. Award an overall grade to the report: 0-10 points
4. Send report to reviewed team

Script 03.07: Evaluation of a requirements document

- **Comprehensibility:** Is the requirement properly understood
- **Validity:** Will the system provide the functions which best support the customer's needs
- **Consistency:** Are there any requirement conflicts
- **Completeness:** Are all functions required by the customer included
- **Realism:** Can the requirements be implemented given available budget and technology
- **Verifiability:** Can the requirements be checked
- **Traceability:** Is the origin of the requirement clearly stated
- **Adaptability:** Can the requirement be changed without a large impact on other requirements?

How can we validate requirements? -> **E.g. Weighted Point Evaluation system**

Task solution

Glossary

Define the term “client” too to avoid misunderstandings since patients are often also referred to as “clients”.

The client/users don’t know agile development practices (mentioned in System evolution) therefore this should also be defined as well as “sprints” (mentioned in Testing).

Functional User requirements

Req #	Category	Comment
10	Realism	Health visitors don't have access to a Patient's File, such uploads must be validated by a doctor.
12	Validity	As doctors aren't primarily users of the program, they will not participate in the chat, consider using a mailing system (e.g. with additional options) instead.
9	Realism	Difficult to realize respecting data protection act. (any such publication must most likely be approved by the patient)
17	Completeness	Consider making a general 'contacts' page that can be extended to multiple purpose.
18	Consistency	This event should not be related to a visit, a section "accommodation" in patient's documentation might be more efficient.
ALL	Consistency	Mentioning 13 makes mentioning 16 unnecessary
ALL	Completeness	Not mentioned that the user wants to initially create appointments in their timetable. See 15, 21, 22

Kommentiert [a1]: Ich finde diese Anforderung ok, falls es vom Arzt validiert werden muss, kann es trotzdem von Spitex hochgeladen und später vom Arzt freigeschaltet werden

Kommentiert [a2]: Die Software sollte schlussendlich glaub schon von allen Akteuren benutzt werden, die Beschränkung auf eine einzelne Usergruppe dient lediglich der Vereinfachung des Projekts. IMHO ist das Requirement ok.

Kommentiert [a3]: Es steht ausdrücklich “ausgewählte Gesprächsprotokolle”. Das könnten also z.B. nur solche sein, bei denen der Patient der Weitergabe zugestimmt hat. Ich habe die Formulierung etwas abgeschwächt, würde es aber sicher drin behalten.

Kommentiert [a4]: 17&18: finde ich als User Requirement ok, das ist mal so wie es sich der User vorstellt, wie die effektive Umsetzung dann aussieht, ist hier noch offen

Kommentiert [a5]: Das eine wünscht eine Skala, das andere Text. Obsolet ist also keines davon. Man könnte sie aber allenfalls zu einem Punkt zusammen fassen, um das Dokument kürzer und lesbarer zu machen. Dies wäre IMHO auch bei anderen Punkten angesagt.

Non Functional User requirements

Req #	Category	Comment
2	Verifiability / Realism	Provide a server/system up time in % “Always” is not a reachable goal. Consider a plan B for the most important uses in case the system doesn’t work (e.g. printouts of some documents)
3	Traceability	Consider mentioning that parts like the alarm button must be perfectly reliable not the whole application (testing effort).
4	Verifiability	Specify “short loading times”, especially mention the case that the application has to be loaded over a slow 2G/3G connection when WiFi/4G is unavailable.
6	Verifiability	Not verifiable, consider "modular architecture" or "plugin supporting architecture"
ALL	Completeness	Should state on what device types the application runs

Functional System requirements

Req #	Category	Comment
-------	----------	---------

2	Comprehensibility	It's not clear what data is mentioned here. If this refers to the backup case of 1, this should be clearly stated.
8	Verifiability	What kinds of exports / imports should be supported (e.g. print, scan, file types).
4	Verifiability	Mention what functions must be accessible by web (defines costs).
7	Completeness	Also mention the need for user groups with different access right (administrators, dept. leaders, health visitors).

Non Functional System requirements

Req #	Category	Comment
1	Verifiability	Specify what kind of attacks, measures
2	Verifiability / Realism	Provide a server/system up time in % "Always" isn't a reachable goal.
4	Realism	Not all Data is available offline due to storage and data protection (e.g. a device getting lost). Instead of "most recent data" it should be stated "recently used data" (i.e. caching).
5	Comprehensibility	Not stated if small or big error tolerance or which context.
6	Verifiability	Not verifiable, consider "modular architecture" or "plugin supporting architecture"
7	Verifiability	Consider mentioning the kind of interfaces to provide (web service, API).

General

Since end users as well as the client belong to the expected readership and you can't expect them to have much technical know-how the document could be shorter to make it easier for them to understand it. This could be achieved by merging user requirements and leaving out information that is not yet needed or might still change at the current stage (e.g. the system model).

Stick to only on language per document. Switching between English titles and German text makes a document harder to read.
